

Dynamic Stochastic General Equilibrium Models

Overview

Dr. Andrea Beccarini

Willi Mutschler, M.Sc.

Institute of Econometrics and Economic Statistics
University of Münster

Summer 2014

Topics of the course

① Introduction

- ① New Keynesian Theory and its main counterparts
- ② Dynamic Programming

② Main theoretical features of the Smets-Wouters model

- ① Households, Firms, Central Bank, Government
- ② Log-Linearization
- ③ Structural and reduced-form

③ The Econometrics of DSGE models

- ① General model representation(s)
- ② Solution methods: linear vs. nonlinear approximation
- ③ Identification of DSGE Models
- ④ Calibration and Impulse-responses
- ⑤ Classical estimation methods: GMM and Maximum Likelihood
- ⑥ Bayesian estimation methods and model evaluation

④ Further topics (if we have time):

- ① Nonlinear estimation methods: Extended/Quadratic Kalman Filter, Particle Filter
- ② Regime switching models

About the Course

- Timetable:
 - Begin of the course: 07.04.2014
 - Mondays 16.00-18:00, CAWM 3
 - Fridays 10.00-12.00, CAWM 3
- Note: There is no distinct separation between lectures and classes
- Parts 1 and 2 will be taught by Andrea Beccarini
- Parts 3 and 4 will be taught by Willi Mutschler, please bring your own laptop, since we will heavily use Matlab and Dynare (www.dynare.org)
- Students who wish to get credit for the course are asked to write a thesis (15-20 pages) covering both a summary as well as an extension or application of one of the topics covered in the course.

Recommended Readings

- An and Schorfheide (2007). "Bayesian Analysis of DSGE Models".
- Canova (2007). Methods for Applied Macroeconomic Research.
- DeJong and Dave (2011). Structural Macroeconometrics.
- Smets and Wouters (2002, 2004). "An Estimated Stochastic Dynamic General Equilibrium Model of the Euro Area"

Further references will be given during the course.
